

Genetically modified viruses (red dots) transmitted by insects have the capacity to modify plant chromosomes in infected cells.

Release insects as a means of delivery for viruses.

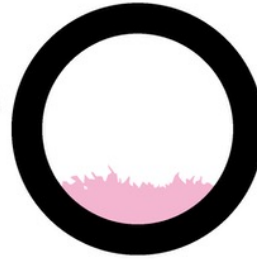

Genetically modified viruses (red dots), transmitted by insects, have the capacity to modify plant chromosomes in infected cells.

**INSECT ALLIES?**

Rapid and flexible way to genetically modify crops for agricultural purposes.

*Technically more difficult, due to need to build necessary agricultural safeguards.*

**INSECT FOES?**

A way to specifically target an enemy's crops, killing them or sterilizing their seeds.

*Technically easier, as safeguards are not required.*
